

Project Title

Simple AI Chatbot using Ollama and Streamlit

Introduction

This project demonstrates how to create a simple AI chatbot using Ollama and Streamlit. Ollama is used to run an AI model locally on the computer, while Streamlit is used to create a simple web-based user interface.

The main purpose of the project is to allow a user to enter a question and receive an AI-generated response from a locally running AI model.

2. What is Ollama?

Ollama is a tool that allows AI models to be downloaded and run locally on a computer. In this project, Ollama is responsible for running the llama3.2:1b model and generating responses to user questions.

3. What is Streamlit?

Streamlit is a Python framework used to create simple interactive web applications. In this project, Streamlit provides the text box where the user enters a question and displays the response generated by the AI model.

4. Ollama Model Used

The model used in this project is:

Llama 3.2 1B (llama3.2:1b)

It is used as the local AI model for answering user questions.

5. How the Application Works

The application works in a simple sequence:

6. Five Prompts Tested

No. Prompt

- 1 What is Artificial Intelligence?
- 2 Explain Machine Learning in simple words.
- 3 What is the difference between AI and Machine Learning?

7. Screenshot

8. What I Learned

Through this project, I learned how to run a local AI model using Ollama and how to connect it with a Python application. I also learned how Streamlit can be used to create a simple user interface for an AI application. The project helped me understand the basic process of sending a user prompt to an AI model and displaying its response.

9. Conclusion

The project successfully demonstrates a simple AI chatbot using Ollama and Streamlit. The user can enter different questions through the Streamlit interface, and the locally running Llama model generates the responses. This project provided a basic understanding of how a local AI model can be connected to a Python-based web interface.
